

Go to chrome and type → **localhost/static/index.js**

It will simply print the content of index.js

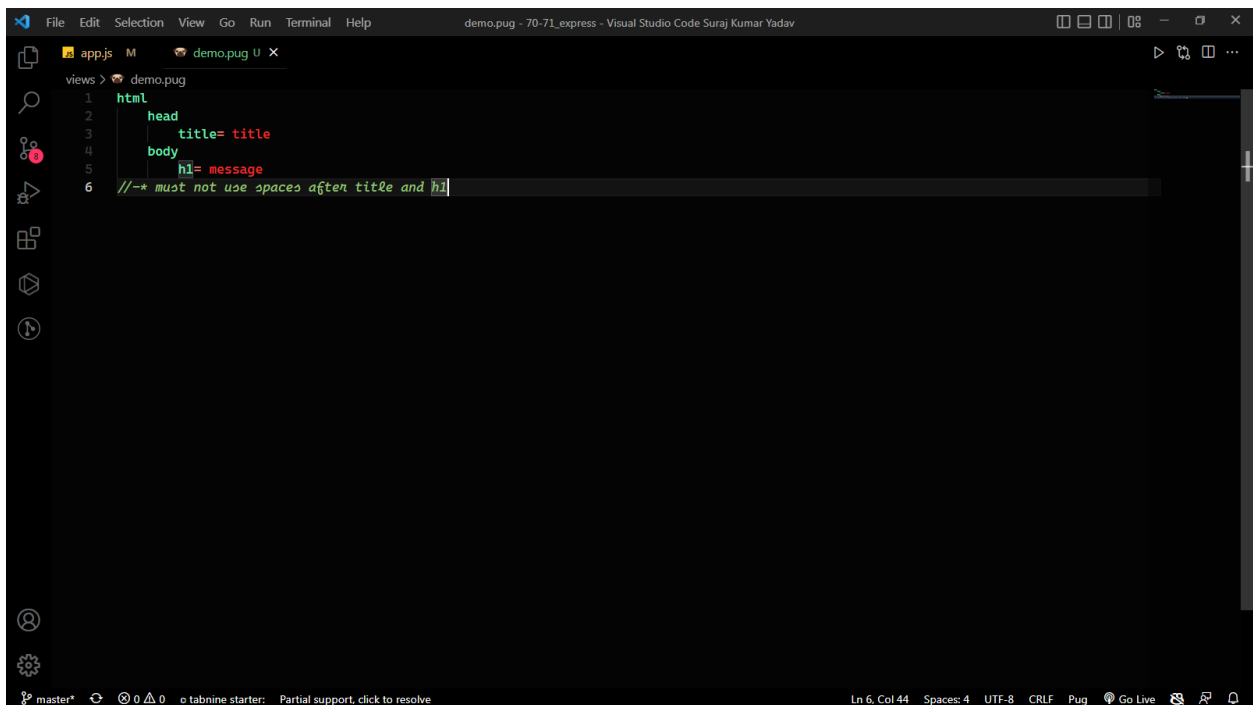

-
- Template Engine: It processes the template → here we are using “pug” template engine.
 - It helps to convert code in html
 - We have to create a endpoint for pug

Type “localhost/demo” in chrome after writing code in pug and adding it in app.js

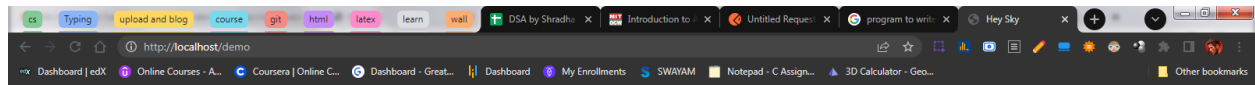

This is the first pug file

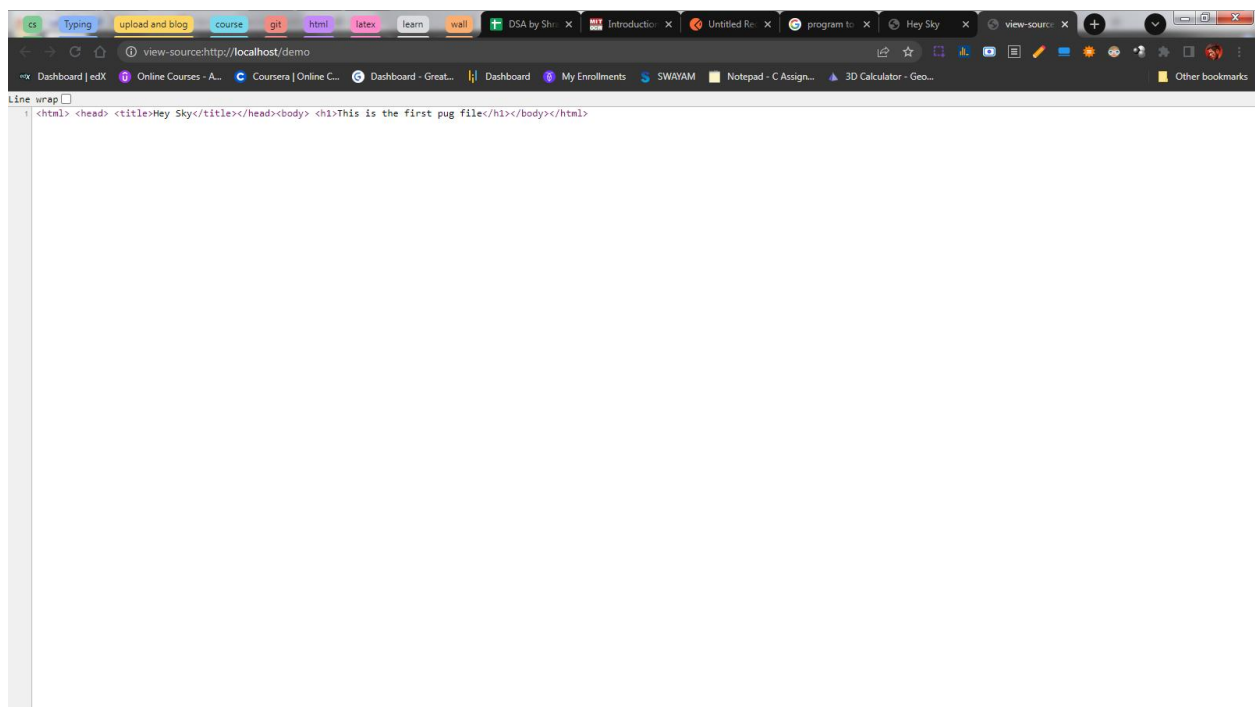

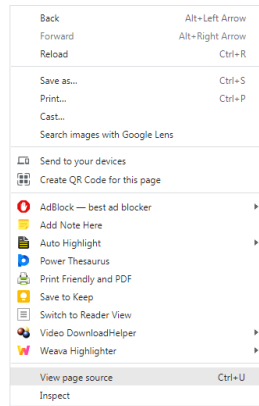

otherwise if you write “title = title” with spaces then it will simply print “= title”

If we click on view page source in chrome after running above file

This is the first pug file

it will create a code for html for whatever we've written in demo.pug
